ABSTRAK

Generator yang disanggah oleh struktur platform yang dimodelkan dalam bentuk numerik dengan metode elemen hingga, dimana elemen yang digunakan adalah elemen pelat berpenegar. Pemodelan dilakukan dengan bantuan paket program MSC/XL dan perhitungan dilakukan dengan MSC/NASTRAN.

Analisa statik dilakukan untuk mengetahui tegangan yang terjadi akibat berat generator dalam kondisi diam, serta dilakukan analisa dinamik yang meliputi perhitungan frekwensi natural dan respons yang terjadi akibat kondisi mesin yang bekerja pada putaran kontinyu.

Pengecekan tegangan dilakukan berdasar standar BKI dan AISC, kemudian frekwensi natural yang terjadi dibanding dengan frekwensi eksitasi dari sumber getar lainnya untuk mengetahui kemungkinan terjadinya resonansi

Respons yang terjadi akibat eksitasi dari generator tersebut dibanding dengan standar ISO untuk mengetahui kelayakan dari struktur tersebut.

KATA PENGANTAR

Dengan mengucapkan puji syukur kehadirat Allah SWT atas segala rahmat dan karunia-Nya, akhirnya penulis dapat menyelesaikan Tugas Akhir ini yang merupakan salah satu persyaratan meraih gelar kesarjanaan pada jurusan teknik perkapalan, Fakultas Teknologi Kelautan ITS Surabaya.

Penulis menyadari apa yang terkandung dalam tulisan ini masih membutuhkan penyempurnaan lebih lanjut. Untuk itu penulis membuka kesempatan bagi upaya demi tercapainya kesempurnaan tulisan ini sehingga dapat memberikan kontribusi yang nyata dalam khazanah pengetahuan.

Pada kesempatan ini penulis ingin menyampaikan rasa terima kasih serta penghargaan yang sebesar-besarnya kepada :

- Bapak Ir. Asjhar Imron MSE, PED. Selaku dosen pembimbing yang telah banyak meluangkan waktu, pemikiran serta mengusahakan fasilitas bagi penyelesaian Tugas Akhir ini.
- Bapak DR. Ir. Ricky Tawekal atas segala fasilitas serta waktu yang disediakan untuk berkonsultasi dan mengoreksi kekurangan-kekurangan yang ada.
- Bapak Ir. Setyo Prajudo MSE. Selaku dosen wali penulis yang selalu membangkitkan motivasi dan memberikan dorongan moril selama masa studi penulis.
- Bapak Ir. Agus Wiyanto, yang memberi ide bagi penulisan ini serta mengusahakan penyediaan data-data yang diperlukan.

- Saudara Ir. N.P Miharjana yang telah banyak membantu dalam Penguasaan materi aplikasi program NASTRAN.
- Seluruh staf Sub.Dit. Mekanika Struktur dan Hidrodinamika PT.PAL INDONESIA.
- Serta semua pihak yang telah membantu kelancaran Tugas Akhir ini.

Pada akhirnya penulis berharap semoga tulisan ini dapat memberi manfaat bagi almamater dan dapat memberi tambahan pengetahuan bagi yang membacanya.

Hormat kami

Penulis

BAB I

PENDAHULUAN

1.1 UMUM

Kapal passenger direncanakan menjadi standar kapal penumpang yang terus dikembangkan. Perlunya untuk diadakan analisa getaran merupakan faktor yang tidak bisa ditinggalkan. Getaran yang berlebihan dapat mengurangi kenyamanan penumpang serta menurunkan efisiensi kerja awak kapal.

Perhitungan frekwensi natural akan dilakukan dengan MSC/ NASTRAN. frekwensi natural yang diperoleh dari perhitungan tersebut dibandingkan dengan frekwensi eksitasi dari sumber getar lainnya untuk mengetahui kemungkinan terjadinya resonansi. Demikian dengan mengetahui respon sampai batas yang diijinkan oleh ISO/TC (*International Organization For Standardization/Technical Commite 108*), maka kenyamanan penumpang maupun awak kapal masih memenuhi standar yang diijinkan.

Dalam makalah ini, jenis getaran yang akan dianalisa adalah getaran pada konstruksi panel kamar mesin. Pembahasan dalam tulisan ini dititikberatkan pada hal-hal sebagai berikut:

- Pemodelan struktur panel dalam model elemen hingga dalam format paket program MSC/NASTRAN.
- Validasi model struktur panel tersebut dengan fasilitas MSC/XL yang terdapat dalam paket program MSC/NASTRAN.

1.2 PEMBATASAN MASALAH

- Analisa permasalahan dilakukan berdasar data yang sudah ada, yaitu data kasus untuk panel 2nd Deck pada kapal penumpang "pax 500"
- Dilakukan analisa statik terhadap struktur, yang meliputi perhitungan deformasi dan tegangan. Penyederhanaan dilakukan untuk mempermudah penyelesaian masalah. Struktur dianggap berada diatas bangunan tetap, tidak mengalami pengaruh pergerakan, hubungan struktur dengan bangunan sekitarnya dianggap tumpuan engsel.
- Dilakukan analisa dinamik terhadap struktur, yang meliputi pencarian frekwensi natural dan respon getaran akibat pengaruh eksitasi dari generator.
- Pengaruh getaran akibat eksitasi dari mesin induk tidak dibahas dalam makalah ini.

1.3 TUJUAN PENULISAN

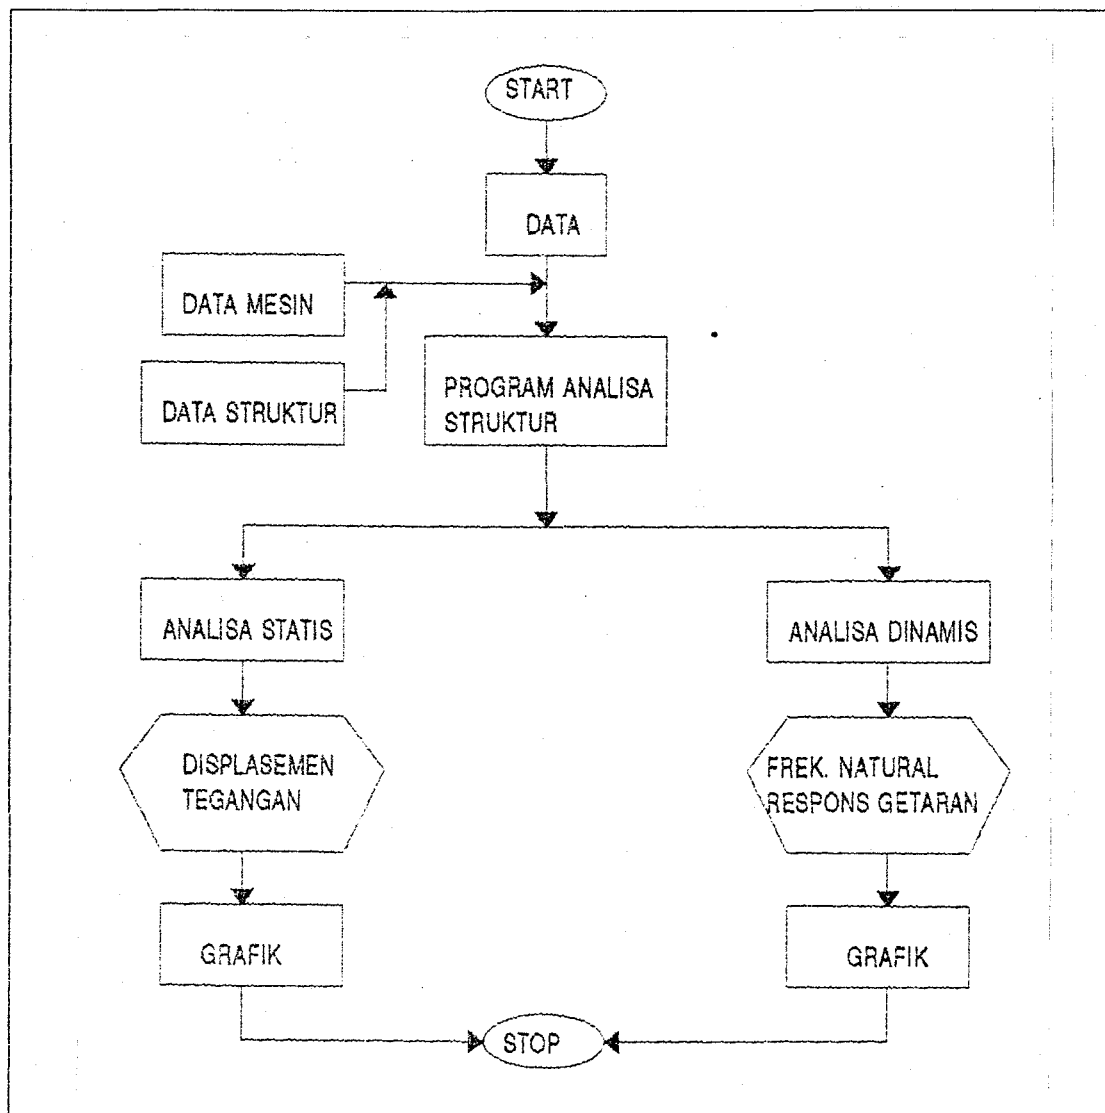

Tujuan penulisan ini adalah menemukan model elemen hingga yang representatif dari struktur panel deck kapal penumpang pax 500, sehingga dapat diterapkan formulasi metode elemen hingga untuk perhitungan statik dan dinamik. Dengan diketahuinya frekwensi natural struktur panel berarti dapat pula dilakukan penanggulangan masalah getaran pada tahap desain. Frekwensi natural tadi dihubungkan dengan frekwensi eksitasi yang timbul dari sumber getar lainnya untuk menghindari terjadinya respon getaran yang berlebihan akibat resonansi.

1.4 METODE PENYELESAIAN.

1.4.1 UMUM

Dalam kesempatan ini akan dilakukan proses analisa struktur platform dari kapal passengcr pax 500, proses analisa ini secara lengkap dapat dilihat pada diagram alir dibawah ini (lihat gambar 1.1).

Sebelum analisa dilakukan terlebih dahulu dilakukan pencarian data struktur (*material, dimensi dan lain-lain*)

Gambar 1.1 : Diagram alir analisa strukutur platform 2 nd deck kapal " pax 500 "

1.4.2. PEMODELAN STRUKTUR

Langkah pertama dalam menganalisa dengan metode elemen hingga (M.E.H) adalah interpretasi struktur kedalam model matematis dengan diskritisasi sistem kontinu kedalam elemen-elemen kecil yang kemudian dihubungkan oleh titik-titik diskrit (*nodal points*). Tahap ini sering disebut sebagai pemodelan atau idealisasi struktur (gambar 1.2).

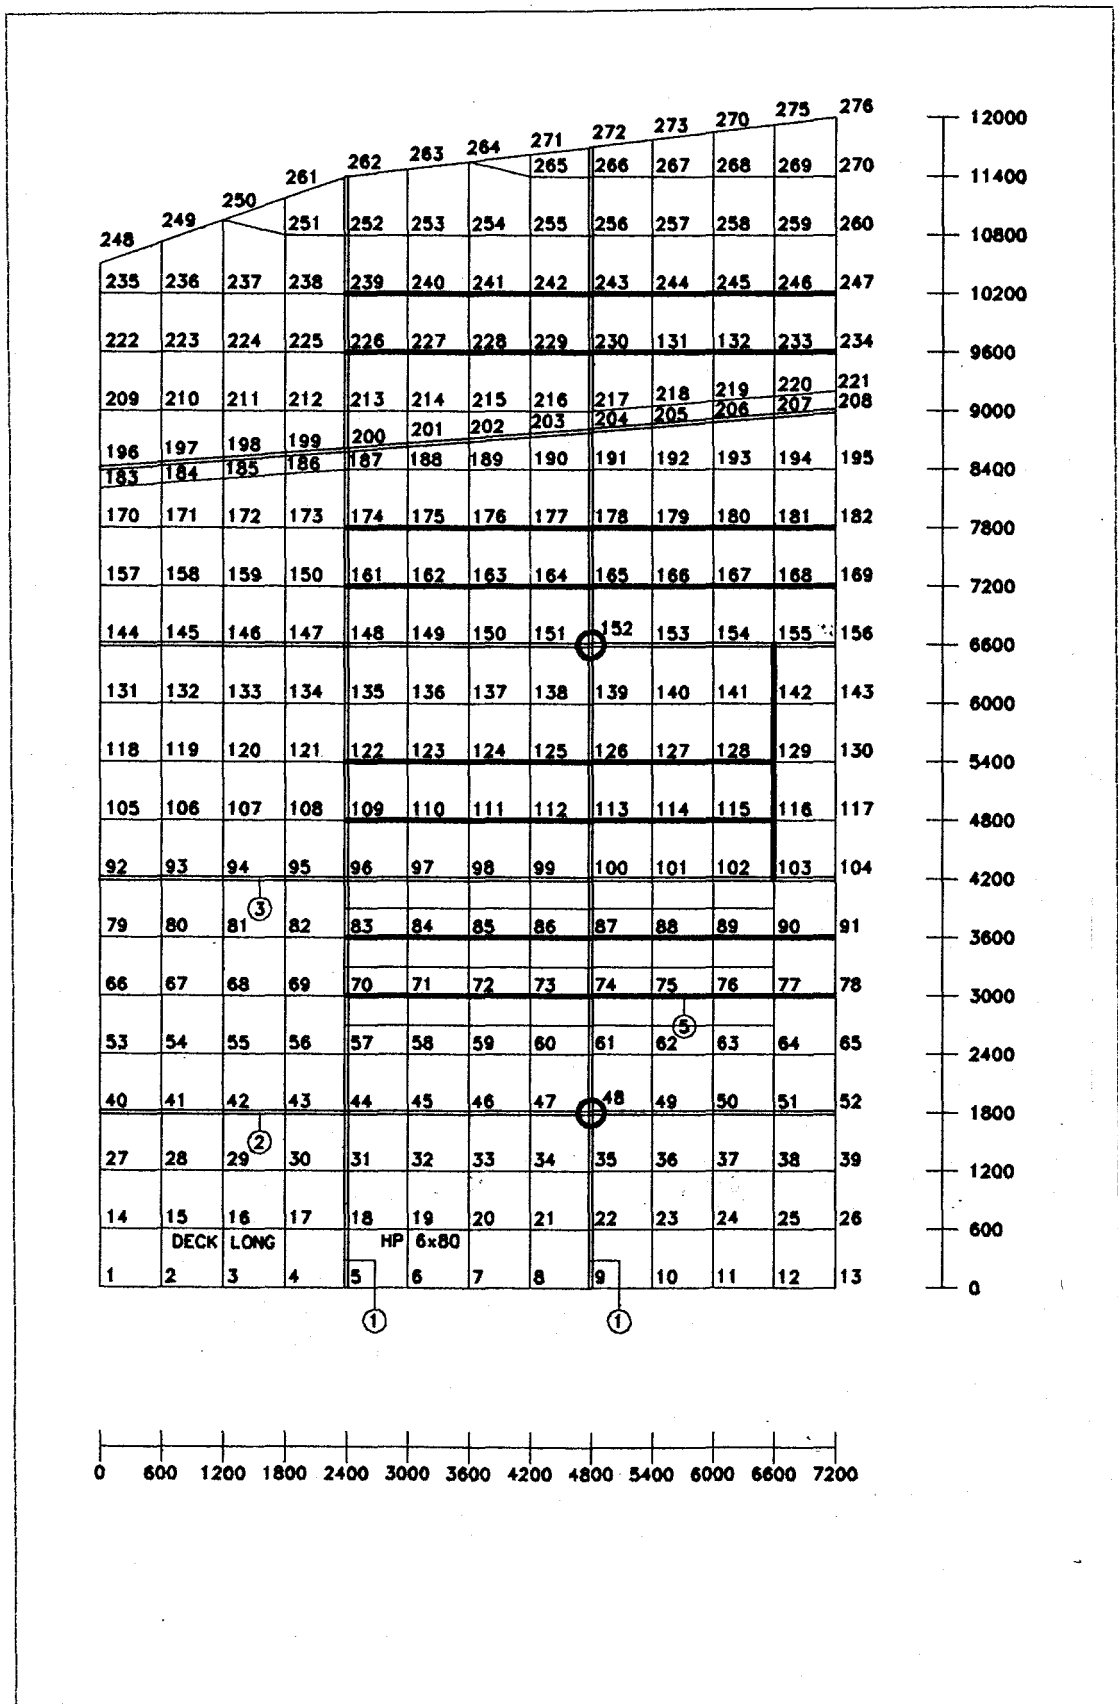

Proses pemodelan struktur merupakan tahap yang paling menentukan dari suatu analisa permasalahan struktur dengan M.E.H, dimana sang pembuat model harus mempunyai pengalaman yang cukup dalam analisa struktur.

Model yang baik merupakan hasil dari kombinasi antara pengalaman (*Engineering judgement*) serta usaha penyempurnaan yang berulang-ulang sehingga diperoleh hasil yang optimal dengan memperhatikan kendala waktu dan biaya komputasi.

1.4.3. VALIDASI MODEL

Pengujian dilakukan dalam dua tahap, yaitu pengujian model geometris yang dilakukan dengan fasilitas MSC/XL yang terdapat dalam MSC/NASTRAN, untuk cek konektivitas antar elemen serta melihat perilaku struktur pada setiap mode yang ditinjau.

Sementara hasil "running" berupa eigenvalue dan eigenvector.

BAB II

TEORI DASAR

II. 1. TEORI PELAT DAN TEORI BALOK

II.1.1. TEORI PELAT KIRCHOFF

Teori pelat Kirchhoff^[10] didasarkan pada asumsi sebagai berikut:

- Deformasi kecil dibandingkan dengan ketebalan pelat.
- Bidang pelat yang normal terhadap bidang tengah tetap berupa bidang datar, dan tetap normal terhadap axis tersebut.
- Tegangan normal terhadap netral axis diabaikan.

Gambar 2.1 : elemen pelat Kirchhoff, tanpa menyertakan pengaruh deformasi geser

Model displasemen dari pelat Kirchhoff dapat dinyatakan sebagai:

$$W = w(x, y) \quad (2.1)$$

Dimana w adalah deformasi ke arah sumbu z .

Berdasar asumsi nomer 2.1, maka displasemen kearah sumbu x dan y adalah sama dengan nol untuk bidang tengah, tetapi displasemen untuk titik diluar bidang tengah tidak sama dengan nol.

Dengan memakai hukum Hooke, maka regangan ε_x dan ε_y dapat dinyatakan sebagai fungsi dari tegangan σ_x dan σ_y sehingga didapatkan :

$$\begin{aligned}\varepsilon_x &= \frac{1}{E} (\sigma_x - \nu \sigma_y) \\ \varepsilon_y &= \frac{1}{E} (\sigma_y - \nu \sigma_x)\end{aligned}\quad (2.2)$$

Dimana E adalah modulus young, dan ν adalah poisson ratio .

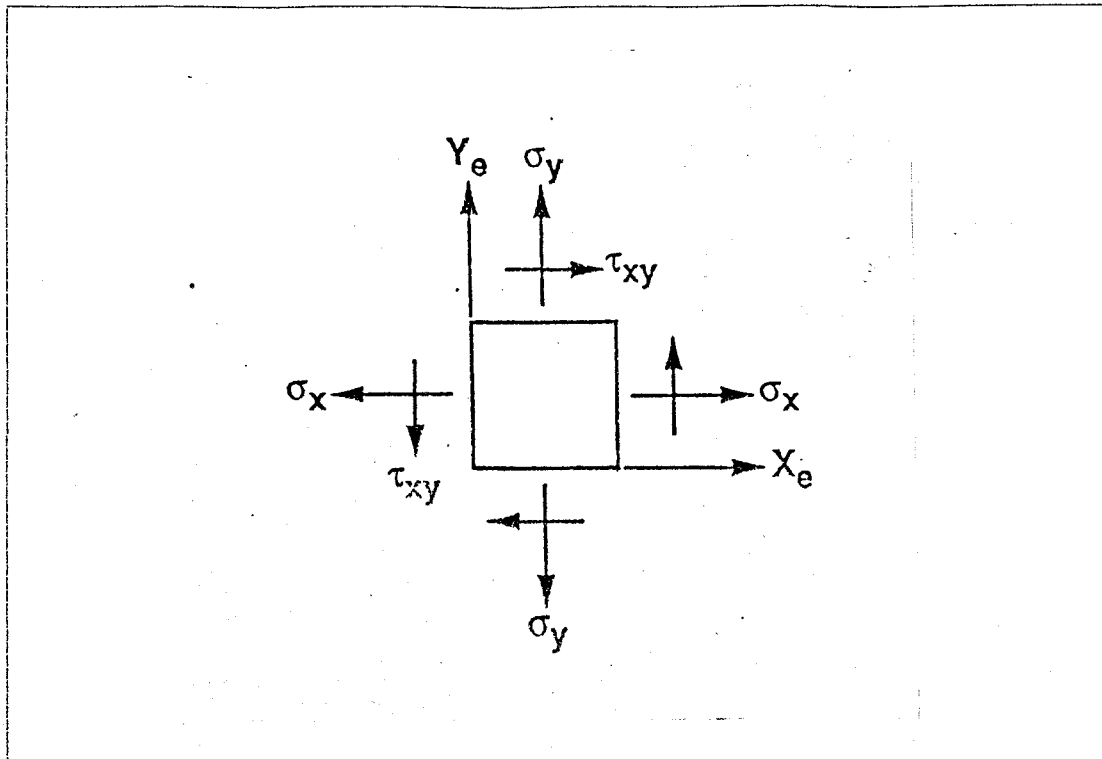

Generalized strain dari pelat tipis Kirchoff adalah :

$$\begin{aligned}\varepsilon &= \left[-\frac{d^2 w}{dx^2}, -\frac{d^2 w}{dy^2}, \frac{d^2 w}{dx \cdot dy} \right] \\ &= \left[\frac{1}{r_x}, \frac{1}{r_y}, \frac{1}{r_{xy}} \right]\end{aligned}\quad (2.3)$$

Dimana $1/r_x$, $1/r_y$ asing-masing adalah kelengkungan terhadap sumbu x dan y, sedangkan $1/r_{xy}$ puntiran permukaan terhadap sumbu x dan y. Dari persamaan (2.2) dan (2.3) dapat diperoleh :

$$\begin{aligned}\sigma_x &= \frac{E \cdot Z}{(1 - \nu^2)} \left(\frac{\partial^2 w}{\partial x^2} + \nu \frac{\partial^2 w}{\partial y^2} \right) \\ \sigma_y &= \frac{E \cdot Z}{(1 - \nu^2)} \left(\frac{\partial^2 w}{\partial y^2} + \nu \frac{\partial^2 w}{\partial x^2} \right) \\ \sigma_{xy} &= \sigma_{yx} = \frac{E}{2(1 - \nu^2)} (1 - \nu) \frac{\partial^2 w}{\partial x \partial y}\end{aligned}\quad (2.4)$$

Dimana σ_x, σ_y masing - masing adalah tegangan normal searah sumbu x dan sumbu y, sedangkan σ_{xy} adalah tegangan geser kearah x sumbu pada bidang x o y. Berikut pada gambar 2.2 mcnggambarkan bentuk tegangan pada pelat.

Gambar 2.1 : Bentuk tegangan pada pelat

(Gambar diambil dari MSC NASTRAN Interactive Training Program)

II.1.2 TEORI BALOK EULER-BERNOULLI

Teori elemen balok Euler - Bernoulli^[6] mempunyai asumsi yang identik dengan teori pelat Kirchoff untuk masalah dua dimensi. Pada balok Euler-Bernoulli tidak ada deformasi ke arah sumbu x dan y pada netral axis, tetapi deformasi pada titik lainya tidak sama nol. Dimana bidang normal terhadap netral axis sebelum deformasi akan tetap lurus dan selalu normal terhadap netral axis sesudah deformasi, sehingga displasemen aksial dapat ditulis sebagai fungsi slope dan balok:

$$U(s, z) = -z \frac{\partial w}{\partial z} \quad (2.5)$$

dimana s adalah koordinat yang sejajar dengan netral axis dari balok, w adalah

displasemen normal terhadap netral axis. Sedangkan harga regangan aksial adalah:

$$\varepsilon(s, z) = \frac{\partial u}{\partial s} = -z \frac{\partial^2 w}{\partial s^2} \quad (2.6)$$

Untuk teori balok Euler-Bernoulli, harga slope balok yang tergantung pada harga displasemen lateral, dimana :

$$\theta s = \frac{\partial w}{\partial s} \quad (2.7)$$

Sehingga cukup diperlukan model displasemen untuk w .

Harga kelengkungan dan momen yang timbul dapat dinyatakan sebagai berikut:

$$\ddot{w}(s) = \frac{d^2 w}{ds^2} ; \text{ dan } M(s) = \int_{-1/2}^{1/2} z \sigma(s, z) dz \quad (2.8)$$

II.2 METODE ELEMEN HINGGA

Prinsip dasar dari metode elemen hingga (MEH) adalah memperlakukan struktur sebagai gabungan elemen-elemen kecil yang disebut finite elemen. elemen-elemen ini dihubungkan oleh titik-titik diskrit yang disebut nodal point atau titik simpul.

Secara ringkas prosedur dalam analisa struktur menggunakan metode elemen hingga adalah sebagai berikut:

II.2.1 PENDISKRITAN STRUKTUR YANG DIANALISA

Ini adalah suatu proses dimana sistim yang dianalisa dibagi menjadi bagian-bagian kecil yang disebut finite elemen. Ada bermacam-macam pilihan elemen, seperti pemilihan tipe, ukuran dan jumlah elemen tergantung pada kecakapan individu yang melakukan analisa. Pemilihan ini juga tergantung pada seberapa kompleks struktur yang dianalisa.

II. 2. 2 PEMILIHAN MODEL DISPLASEMEN

Model dari displasemen yang dipilih tentu saja hanyalah perkiraan saja, akan tetapi memenuhi persyaratan pokok tertentu. Berikut adalah tiga persyaratan utama yang harus diperhatikan:

- Tipe dan derajat kebebasan dari displasemen harus ditentukan. Karena lajimnya polinomial yang harus ditentukan
- Besaran besaran displasemen tertentu yang menggambarkan keadaan modelnya harus ditentukan. Biasanya ini adalah besaran-besaran displasemen pada nodal points. Akan berarti bisa berarti turunan dari displasemen tersebut.
- Model yang dipilih harus memenuhi persyaratan khusus yang memungkinkan penyelesaian numeriknya menghasilkan hasil.

II. 3 TEORI GETARAN

II. 3. 1 FREKWENSI NATURAL DAN MODE SHAPES

Seperti kita ketahui untuk mengetahui frekwensi natural ⁽⁷⁾ dan mode shapes, kita asumsikan dumping dan gaya eksitasi sama dengan nol.

$$[M]\{\ddot{q}\} + [K]\{q\} = \{0\} \quad (2.9)$$

penyelesaian tersebut bisa ditulis dengan asumsi :

$$\{q_i\} = \{\Phi_i\} \sin(\omega_i t + \alpha_i) \quad (210)$$

dimana : $i = 1, 2, 3, \dots, n$

n = jumlah derajat kebebasan

dengan menurunkan dua kali didapat :

$$\{\ddot{q}_i\} = -\omega_i^2 \{\Phi_i\} \sin(\omega_i t + \alpha_i) \quad (2.11)$$

Substitusikan persamaan (2.10) dan (2.11) ke persamaan (2.9) akhirnya didapat:

$$([K]\{\Phi_i\} - \omega_i^2[M])\{\Phi_i\} = \{0\} \quad (2.12)$$

Tidak lain dari masalah " eigenvalue " (atau tepatnya " non standart eigenvalue problem). Dimana ω_i adalah frekwensi natural, sedangkan $\{\Phi_i\}$ adalah mode shapes .

Untuk menyelesaikan dengan komputer kita perlu merubah bentuk tidak standar menjadi bentuk " standar eigenvalue " (yaitu simetris)

$$[A] - \lambda_i [I] \{X_i\} = \{\Phi_i\} \quad (2.13)$$

dimana : $[A]$ adalah matriks simetris

$[I]$ adalah matrik identitas

λ_i adalah eigenvalues

$\{X_i\}$ adalah eigenfunction

Perubahan (transformasi) diatas kita lakukan dekomposisi . terlihat bahwa masalah pencarian frekwensi natural dan mode shapes ini tidak identik dengan masalah aljabar eigenvalue problem

Dekomposisi matrik $[K]$ atau bisa juga $[M]$ menjadi :

$$[K] = [U]^T [U] \quad (2.14)$$

Subtitusikan persamaan (2.14) ke persamaan (2.12) dan didapat :

$$([U]^T [U] - \omega_i^2 [M]) \Phi_i = \{0\} \quad (2.15)$$

Dan dilakukan perkalian ruas kiri dan kanan dengan $[U]^{-T}$

$$[U]^{-T} ([U]^T [U] - \omega_i^2 [M]) [U]^{-1} \{\Phi_i\} = \{0\}$$

Dalam bentuk sederhana ditulis :

$$[M]_0 - \lambda_i [I] \{\Phi_i\} = \{0\} \quad (2.16)$$

dimana : $[M]_v = [U]^{-T} [M] [U]^{-1}$

$$\lambda_j = \frac{1}{w_j^2}$$

$$\{\Phi_j\} = [U] \{\Phi_j\}$$

Persamaan (2.16) sekarang identik dengan persamaan standareigenvalue (2.13)

II.3.2 LANGKAH PERHITUNGAN RESPONS

Untuk mendapatkan respons getaran^[4] akibat eksitasi harmonik digunakan metode yang dikenal dengan "Direct Integration method". Pada analisa dengan metode ini dikenal dua jenis analisa yaitu, " Direct frequency Response analysis dan Direct Transient Response Analysis "

Direct frequency response analysis sering digunakan untuk analisa respons getaran akibat adanya putaran mesin yang berubah-ubah. Pada mesin diesel, umumnya respons yang didapat cenderung meningkat hingga mendekati kondisi "peak" akibat adanya pertambahan putaran mendekati putaran maksimal.

Direct transient response analysis biasanya digunakan untuk memprediksi respons pada kondisi putaran tertentu, yaitu pada putaran kontinyu (Rpm service).

Persamaan umum gerakan yang diberikan oleh NASTRAN sebagai berikut :

$$[M] \{\ddot{u}\} + [B] \{\dot{u}\} + [K] \{u\} = \{P(t)\} \quad (2.18)$$

dimana :

$\{u\}$ adalah komponen displasemen pada grid point (nodal point)

$\{\dot{u}\}$ adalah vektor kecepatan pada grid point

$\{\ddot{u}\}$ adalah vektor percepatan pada grid point

$[M]$ adalah matrik massa

$[B]$ adalah matrik damping

$[k]$ adalah matrik kekakuan

$\{P(t)\}$ adalah gaya eksitasi

Diasumsikan gayanya adalah sebagai berikut :

$$\{P(t)\} = \{P \sim\} e^{i\omega t} \quad (2.19)$$

$$\{u(t)\} = \{u \sim\} e^{i\omega t} \quad (2.20)$$

Harga komponen displasemen pada persamaan (2.20) diturunkan dua kali dan hasilnya disubstitusikan ke persamaan (2.18) akan didapat :

$$[M] (i\omega)^2 \{u \sim\} e^{i\omega t} + [B] (i\omega) \{u \sim\} e^{i\omega t} + [K] \{u \sim\} e^{i\omega t} = \{P \sim\} e^{i\omega t} \quad (2.21)$$

dengan menghilangkan harga $e^{i\omega t}$ didapat :

$$(\omega^2 [M] + i\omega [B] + [K]) \cdot \{u \sim\} = \{P \sim\} \quad (2.22)$$

Sehingga penyelesaian dari respons getaran adalah :

$$\{u \sim\} = [Z(\omega)]^{-1} \{P \sim\}$$

$$\text{dimana : } [Z](\omega)^{-1} = (-\omega^2 [M] + i\omega [B] + [K])$$

BAB III

PEMODELAN STRUKTUR PANEL 2nd DECK

Dalam analisa menggunakan metode elemen hingga, tahap yang paling penting dan memakan waktu adalah tahap pemodelan struktur. Pada tahap ini ditentukan letak simpul, jenis dan bentuk elemen, properti elemen dan lain-lain.

Pemodelan tidak bisa dilakukan satu dua kali saja tapi merupakan suatu pekerjaan yang dilakukan berulang-ulang sampai didapat model yang perilakunya dapat mewakili struktur sebenarnya.

Sebelum kita melakukan pemodelan yang baik dan benar terlebih dahulu dilakukan pencarian data. Adapun data yang diperlukan adalah sebagai berikut :

A. DATA MESIN

Jenis mesin	: Diesel - Generating Set 425 KVA
Berat mesin	: 5200 kg
Panjang mesin	: 3560 mm
Type	: 1609 N.W : 200
Rpm	: 1500
Jumlah silinder	: 12
Berat mesin	: 2.3 kg
Berat Crank	: 1,87 kg
Berat piston rod	: 4 kg
Panjang piston rod	: 261,62 mm

Diameter	: 137 mm
Langkah	: 152 mm
Jari - jari Crank	: 62 mm
Connecting rod ratio	: 0,42

B. DATA STRUKTUR

1. Web beam (250x8 + 80x8)

Luas	: 2640 mm^2
Momen inersia penampang	: 18488000 mm^4
Eksentrisitas	: -156,273
Bidang	: 0,1,1

2.. Centre Girder (300x10 + 100x15)

Luas	: 4500 mm^2
Momen inersia penampang	: 47334000 mm^4
Eksentrisitas	: - 202,5 mm
Bidang	: 1,0,1

3 . Side Girder (350x10 + 150x15)

Luas	: 5750 mm^2
Momen Inersia penampang	: $35771354,17 \text{ mm}^4$
Eksentrisitas	: - 246,413 mm
Bidang	: 1,0,1

4 . Pondasi (250x7 + 80x14)

Luas	: 2870 mm ²
Momen Inersia Penampang	: 9132876,663 mm ⁴
Eksentrisitas	: 176,512 mm
Bidang	: 0,1,1

5 . Cross Beam (250x8 + 80x8)

Luas	: 2640 mm ²

III .1. ASPEK PEMODELAN

Cara umum dalam pencrapan pemodelan adalah pemilihan elemen yang sesederhana mungkin dengan memperhatikan kendala biaya dan waktu. hal -hal yang mempengaruhi dalam pemodelan antara lain.

a. TITIK SIMPUL

Titik simpul adalah menggambarkan tempat adanya perpindahan (*deformasi*) dan aliran gaya pada struktur sesuai dengan derajat kebebasannya (*translasi dan rotasi*), komparabilitas perpindahan, penentuan titik koordinat dalam suatu titik, referensi yang tepat harus diperhatikan pada tahap awal pemodelan.

b. JENIS ELEMEN.

Jenis elemen menggambarkan model fisis kedalam bentuk model matematis. berdasarkan hal ini pemodel perlu mengenal kekakuan tiap elemen dan sifat fisis struktur.

c. BENTUK ELEMEN

Bentuk elemen terutama pada elemen bending, mempengaruhi karakteristik elemen dalam distribusi kekakuan.

d. UKURAN / JUMLAH ELEMEN

Ukuran matrik kekakuan keseluruhan ditentukan oleh jumlah / ukuran elemen (*derajat kebebasan*) dalam suatu model struktur. penentuan ukuran elemen tersebut antara lain tergantung pada pengkajian (*efisiensi, ketelitian*) dan geometri struktur keseluruhan.

e. TAHAPAN ELEMEN (GRADING OF ELEMENT)

Tahapan elemen sangat menentukan penyelesaian matriks kekakuan keseluruhan (*global stiffeners matriks*), sehingga harus dihindari adanya tahapan yang besar antara ukuran elemen yang satu dengan ukuran elemen sekitarnya.

f. SISTIM PENOMERAN

Sistim penomeran simpul dan elemen sangat mempermudah dalam pembuatan masukan, pengecekan dan pengkajian akhir. misalnya nomer simpul dan elemen berdasarkan part, subpart dan urutan (*sequence*).

MSC/NASTRAN dilengkapi dengan *rigit format alter* untuk resequencing sistim penomeran, sehingga bandwidth matriks dapat direduksi.

Bagaimanapun juga diperlukan sistim penomeran yang baik dan sistematis untuk pemeriksaan kembali atau untuk mengantisipasi perubahan-perubahan yang mungkin perlu dilakukan.

g. KONDISI BATAS

Platform 2 nd deck yang dianalisa terletak pada frame no 8 hingga frame no 20 dengan dibatasi oleh sekat melintang bagian depan dan belakang, serta oleh lambung pada bagian kiri kapal seperti pada gambar 3.3 dan 3.4.

Bentuk konstruksi platform 2 nd deck terdiri dari pelat dengan sejumlah penegar memanjang, pondasi mesin, side girder dan centre girder yang terletak sejajar dengan arah memanjang kapal dan web beam yang arahnya melintang kapal.

Kondisi batas diberikan seperti pada gambar 3.3, dengan memberikan penomoran pada sisi-sisi dari pada struktur platform 2 nd deck. Nomer 1 dan nomer 3 akan mempunyai perilaku yang sama, sedang nomer 2 akan sama dengan nomer 4. Pada nomer 1 dan 3 diambil tumpuan (*constraint 12346*) yang berarti bahwa grid sepanjang sisi tersebut dapat berputar terhadap sumbu y. Sedang pada nomer 2 dan 4 diambil tumpuan 12356 berarti bahwa grid sepanjang sisi tersebut dapat berputar terhadap sumbu x. Sedang untuk grid selain disebutkan diatas diberi notasi 6 yang artinya tidak bisa rotasi terhadap sumbu z.

Gambar 3.2: Elemen BAR (Gambar diambil dari MSC/NASTRAN Interactive Training Program

III . 2 . PEMODELAN STRUKTUR PLATFORM .

Untuk pemodelan struktur platform seperti pada gambar 1.2 , model dibuat sedemikian hingga menyerupai bentuk struktur yang sesungguhnya.

Didalam analisa menggunakan metode elemen hingga, semakin kecil ukuran elemen (artinya semakin banyak jumlah simpul dan jumlah elemen) akan semakin baik juga perhitungan yang dihasilkan. karena keterbatasan fasilitas dan kemampuan komputasi, diperlukan pembatasan jumlah simpul.

Dibawah ini disajikan pembahasan mengenai pertimbangan pemilihan elemen dan jenis elemen yang dipilih untuk memodelkan struktur.

Gambar 3.2 : Elemen QUAD4

(Gambar diambil dari MSC/NASTRAN Interactive Training Program)

III .2 . 1 PEMILIHAN ELEMEN

Dasar utama dari pemilihan elemen adalah sifat (*property*) dan kelakuan (*behaviour*) dari elemen dan struktur yang akan diwakili oleh elemen tersebut.

Dalam hal pertimbangan pemilihan elemen untuk struktur platform 2 nd deck adalah menggunakan elemen BAR untuk mewakili dari struktur girder, web frame, girder memanjang. Sedang untuk elemen QUAD4 dan TRIA3 untuk mewakili elemen pelat.

III .2.1.1 ELEMEN BALOK

Seluruh konstruksi dari panel terdiri dari plat yang diperkuat oleh profil. peletakan simpul pada model struktur ini dibuat dengan meletakkan pada setiap jarak dari deck long dan jarak gading, ini bertujuan untuk mempermudah pembuatan model.

Gaya lateral yang terjadi menyebabkan bending pada bidang satu (*plane 1*) seperti pada gambar 3.1. Bidang satu diasumsikan sebagai batang yang tegah lurus terhadap bidang plat tempat melekatnya struktur tersebut.

Dalam paket program MSC/NASTRAN dikenal dua jenis elemen balok, yaitu BEAM dan BAR element. Dalam analisa ini dipilih elemen BAR, karena elemen ini dianggap mampu mewakili sifat serta kelakuan struktur tersebut.

III .2.1.2. ELEMEN SHELL

Elemen shell diharapkan dapat mewakili sifat serta kelakuan dari struktur plat tersebut.

Dalam paket program MSC/NASTRAN, elemen semacam itu diwakili oleh elemen QUAD4 untuk elemen segiempat dan TRIA3 untuk mewakili elemen segitiga. Angka yang terletak pada akhir nama elemen tersebut menyatakan jumlah

simpul yang terdapat pada tiap elemen.

Kedua bentuk elemen tersebut (QUAD dan TRIA) merupakan representasi dari formulasi elemen isoparametris, yaitu elemen dimana parameter yang akan digunakan untuk ekspresi geometri dari elemen sama jumlahnya dengan parameter yang digunakan untuk ekspresi model displacemen.

Pada gambar 3.2 dapat dilihat gaya-gaya dan momen yang bekerja pada elemen QUAD4.

III . 2 . 2 SISTIM PENOMERAN

MSC/NASTRAN dilengkapi dengan *RIGIT FORMAT ALTER* yang mengatur kembali penomeran secara internal tanpa mengubah identitas eksternal yang telah diberikan pada pemakainya.

Algoritma ini sangat membantu karena kita tidak perlu lagi dipusingkan oleh adanya bandwith yang terlalu besar akibat sistem penomeran yang kurang baik.

III . 2 . 3 CONSTRAINT (KONDISI TUMPUAN)

Constraint adalah sarat batas yang harus diberikan untuk menyelesaikan perhitungan ini. constraint memegang peranan penting karena berkaitan erat dengan bentuk respons yang diinginkan. dengan mengasumsikan bentuk respon yang diinginkan, maka dapat ditentukan constraint pada tempat tertentu. bagaimanapun, diperlukan uji coba yang berulang-ulang untuk mendapatkan respons yang benar.

Simpul yang perlu diconstraint adalah simpul-simpul yang terletak pada sisi luar dari struktur atau tepi-tepi struktur dan pillar.

Penyempurnaan constraint dapat dilakukan setelah melihat hasil run dari

MSC/NASTRAN dan simulasi getaran pada MSC/XL. walaupun MSC/NASTRAN memiliki algoritma yang dapat menghitung constraint pada simpul secara otomatis (*khususnya pada simpul yang dibuat bebas*), beberapa simpul masih saja mengalami kegagalan gerakan (*failed direction*) baik arah translasi maupun arah rotasi. ini dapat dilihat pada grid point singularity table yang dihasilkan MSC/NASTRAN. untuk itu pada simpul-simpul tersebut perlu dilakukan kekangan dalam arah yang sesuai.

Dengan melihat simulasi getaran yang ditampilkan oleh MSC/XL, dapat dilihat apakah bentuk getaran sudah sesuai dengan asumsi bentuk respons yang diinginkan. jadi walaupun penyempurnaan constrain sudah dilakukan berdasarkan grid point singularity table, tetap dibutuhkan kemampuan analisa yang baik agar dapat menentukan sendiri constraint yang benar. sehingga bentuk simulasi getaran yang ditampilkan oleh MSC/XL sesuai dengan asumsi respons yang diinginkan.

III . 2 . 4 KOMPABILITAS SIMPUL

Dalam proses diskritisasi suatu sistim kedalam model elemen perlu diperhatikan kompatibilitas (*kesesuaian*) dari simpul dengan elemen yang didefinisikanya.

Ketidaksesuaian (*incompatibility*) biasanya terjadi bila simpul yang terlewati (*tidak didefinisikan*) pada saat pemodelan elemen. ini menyebabkan hasil run tidak sesuai dengan respon struktur yang sesungguhnya . dalam hal ini perhitungan, incompatibility akan menghasilkan getaran lokal dimana pada masing-masing simpul punya perhitungan sendiri.

Bentuk model struktur platform 2nd deck kapal pax. 500 dilihat pada

gambar (1.2). model tersebut terdiri dari :

Jumlah simpul = 273

Jumlah elemen BAR = 233

Jumlah elemen QUAD4 = 242

Jumlah elemen TRIA = 2

BAB IV

GAYA EKSITASI AKIBAT BEBAN GENERATOR

Mesin piston saat beroperasi dapat menimbulkan eksitasi sebagai sumber getar. hal ini terjadi karena pada saat mesin beroperasi terjadi perputaran massa engkol dalam mesin yang eksentris terhadap sumbu putarnya dan massa piston yang bergerak bolak-balik pada sumbunya. pembebanan mesin yang sedang beroperasi ini besarnya berubah-ubah menurut perubahan waktu yang dapat dinotasikan sebagai bentuk sinus maupun cosinus.

Gambar 4.1 : Gerakan crank (gambar diambil D.N.V)

Secara garis besar gaya eksitasi^[3] yang ditimbulkan oleh mesin dapat dibedakan menjadi dua bagian, yaitu :

- Gaya Inersia
- Gaya eksitasi gas

Selanjutnya akan dibahas perhitungan gaya-gaya eksitasi ini, yang nantinya akan dipakai sebagai sumber eksitasi untuk analisa platform 2nd deck.

IV. 1 PERHITUNGAN GAYA EKSITASI

IV.1.1 PERHITUNGAN EKSITASI INERSIA

Gaya inersia yang ditimbulkan oleh mesin tipe piston ini akan berbentuk fungsi harmonik, akibat gaya eksitasi dari piston yang bergerak naik turun dan engkol yang berputar didalam silinder.

Gambar 4.2 : Mekanisme pergerakan engkol dan piston (gambar diambil dari DNV)

Pada gambar 4.1 tampak gaya- gaya yang muncul saat engkol bergerak untuk satu silinder. gaya P dikomposisi ke arah horizontal sebagai Guide Force (G) dan suatu Connecting Rod Force (S) pada crosshead. sementara gaya S yang beraksi pada crank dapat dikomposisi ke arah tangensial (T) dan ke arah radial (R). komposisi radial akan mengarah ke pusat poros dan akan menyebabkan terjadinya bending dari crankshaft. komponen ini juga akan menyebabkan timbulnya gaya aksial yang mana merupakan sumber dari getaran tangensial merupakan sumber utama dari gerakan torsional poros.

Berikut pada gambar 4.2 dapat dilihat sebuah engkol yang panjangnya r berputar bergerak mengelilingi titik pusat O (*sumbu putar crankshaft*), dengan kecepatan ω . stang piston yang panjangnya L , menghubungkan piston pada titik P (*wristpin*) dengan engkol pada titik C (*crankpin*). massa pada titik P melakukan gerakan naik turun, sedangkan titik C melakukan gerakan melingkar dengan jari-jari r yang berpusat di O . massa total yang melakukan gerakan naik turun (*Reciprocating*) mengikuti gerakan piston disebut massa *Reciprocating* (*Reciprocating Mass*) yang terletak pada Crosshead (M) dan besarnya adalah :

$$M_{Rec} = M_2 + M_3 (L_1/L) \quad (4.1)$$

Disisi lain massa total yang melakukan gerakan melingkar (rotation) yang mengikuti gerakan engkol disebut massa rotasi (*Rotating mass*) yang terletak di crankpin (C) dan besarnya adalah sebagai berikut :

$$M_{Rot} = \frac{L_1}{L} \cdot M \cdot \frac{r_1}{r} + M_3 \cdot (1 - \frac{L_1}{L}) \quad (4.2)$$

Dimana :

$$M_1 = \text{massa engkol (kg)}$$

M_2 = massa yang bergerak naik-turun (seperti: piston, wristpin, kepala engkol) (kg)

M_3 = massa stang piston (kg)

L = Panjang stang piston (m)

L_1 = jarak antara pusat stang piston dengan crankpin (m)

r_1 = jarak antara pusat berat poros engkol dengan titik pusat crankshaft (m)

r = jari-jari crank (m)

Θ = Sudut Crank

Selanjutnya gaya inersia yang arahnya vertikal dapat ditulis sebagai berikut:

$$f_v = \Omega^2 r \left[(M_{Rec} + M_{Rot}) \cos \Theta + M_{Rec} \left(\lambda + \frac{\lambda^3}{4} \right) \cos 2\Theta - M_{Rec} \cdot \frac{\lambda^3}{4} \cos 4\Theta \right]$$

.....(4.3)

Dimana :

Ω = kecepatan angular (rad/det²)

r = jari-jari crank (m)

λ = connecting rod ratio = r / L

L = panjang connecting rod (m)

Selanjutnya dengan memasukkan harga data mesin yang sesuai seperti pada bab terdahulu dengan putaran mesin pada putaran 1500 rpm menghasilkan eksitasi seperti pada gambar 4.3.

Grafik Gaya Eksitasi

Gambar 4.3 : Bentuk grafik gaya eksitasi akibat gaya inersia dan gaya gas.

IV.1. 2 PERHITUNGAN EKSITASI GAS

Eksitasi ini terjadi akibat adanya pembakaran bahan bakar dan udara pada ruang pembakaran. eksitasi ini bila diwujudkan dalam bentuk fungsi adalah harmonik. [9] Pertrovsky memberikan estimasi untuk perhitungan eksitasi akibat tekanan gas yang besarnya adalah sebagai berikut :

$$F_{gh} = P_g A$$

dimana:

P_g = adalah tekanan yang bekerja pada silinder head (kg/m^2)

$$A = \frac{\pi D^2}{4} \quad (\text{m}^2) \quad (4.4)$$

D = jari-jari silinder (m)

Harga pendekatan untuk mencari P_g dapat dilihat pada gambar 4.4 merupakan fungsi langkah torak dan sudut phase.

Gambar 4.4 : Estimasi untuk mencari harga P_g

(Gambar diambil dari Marine Internal Combustion Engine)

IV.2 PENYALURAN GAYA KE TUMPUAN (TRANSMISIBILITAS)

Untuk mengetahui besarnya gaya yang disalurkan ke tumpuan (*pondasi*) ditinjau suatu osilasi dengan gaya harmonik sederhana $F(t) = F_0 \cos \omega t$ yang bekerja pada massa seperti tampak pada gambar 4.5

Gambar 4.5 : Osilasi teredam dengan gaya harmonis sederhana

Persamaan diferensial dari gerak ini adalah :

$$M \ddot{x} + C \dot{x} + K x = F_0 \cos \omega t \quad (4.5)$$

dengan penyelesaian steady statenya adalah :

$$x = X \cos (\omega t - \theta) \quad (4.6)$$

dimana jika $r = \frac{\omega}{\omega_n}$ maka :

$$X = \frac{F_0/k}{\sqrt{(1-r^2)^2 + (2\rho r)^2}} \quad (4.7)$$

Gaya tersalurkan tumpuan melalui elemen pegas dan elemen redaman, dan grafik transmisibilitas [3] didefinisikan sebagai ratio dari gaya maksimum yang ditransmisikan ke tumpuan dengan gaya dinamis maksimum, yaitu :

$$T_R = \left[\frac{1 + (2\rho r)^2}{(1-r^2)^2 + (2\rho r)^2} \right]^{1/2} \quad (4.8)$$

Gambar 4.6 : grafik transmisibilitas (gambar diambil dari D.N.V)

IV. 3 PEMODELAN GAYA SIMPUL EKIVALEN

Untuk memperoleh nilai respons getaran struktur platform 2 nd deck akibat eksitasi dari generator, diasumsikan gaya yang tersalur ke tumpuan didistribusikan menjadi enam gaya tiap mesin seperti pada gambar 4.7 dimana F_v adalah gaya eksitasi yang merupakan fungsi harmonik dengan sudut phase yang berbeda-beda. Mesin langsung ditempatkan diatas pondasi dan diasumsikan struktural damping sebesar 0,06.

Gambar 4.7 : Pemodelan gaya simpul ekivalen

BAB V

ANALISA HASIL DAN VALIDASI MODEL

V.1. VALIDASI MODEL

Proses validasi model perlu dilakukan untuk menyatakan keabsahan suatu struktur dengan melakukan beberapa tahap pengecekan keluaran (*output*)^[5]. keluaran perhitungan metode elemen hingga diharapkan sedekat mungkin dengan respon struktur yang sesungguhnya. pemodelan yang baik adalah pemodelan yang menghasilkan perbedaan keluaran yang relatif kecil. adapun tahap pengecekan output adalah :

V.1.1. CEK GEOMETRI DAN TOPOLOGI

Pemeriksaan bentuk model keseluruhan dan hubungan antara elemen (*simpul penghubung elemen*) diperlukan untuk melihat apakah bentuk model keseluruhan sesuai dengan yang seharusnya. dengan adanya tampilan grafis yang disajikan oleh MSC/XL, pemeriksaan dapat dilakukan dengan mudah.

A. CEK GEOMETRI

Yang perlu ditinjau dalam pengecekan geometri adalah bentuk dan ukuran elemen .pengecekan pada tahap ini berlaku untuk elemen CQUAD4 dan TRIA3.

Ada dua cara yang biasa dilakukan untuk pengecekan geometri, yaitu :

- Menggunakan fasilitas yang terdapat dalam MSC/XL , terdapat dalam menu check FEM .
- Menggunakan hasil RUN dari MSC/NASTRAN. bila terdapat banyak elemen yang geometrinya jelek (*bad geometry*) menurut kriteria diatas, maka Run NASTRAN terhenti (*terminated*). pada file hasil Run ditampilkan nomerelemen yang jelek, juga kriteria yang tidak bisa dipenuhi oleh elemen tersebut. pengecekan dari penyempurnaan elemen dilakukan berulang-ulang sampai Run NASTRAN berhasil (*job completed*). adakalanya pada file hasil run ditampilkan elemen-elemen yang memiliki geometri yang buruk, sementara hasil Run NASTRAN tidak terhenti. pada kondisi ini, modelnya sudah cukup valid.

B. CEK TOPOLOGI

Cek topologi meliputi :

- Konektivitas elemen, jangan sampai ada celah (*gap*) dan penumpukan (*overlapping*) elemen . untuk pengecekan elemen dapat dilakukan dengan menu (MSC/XL) flatshaded. sedang untuk pengecekan adanya penumpukan simpul dan elemen dilakukan dengan menggunakan menu (MSC/XL) check FEM/FIND dan equivalence / grid point or elemen.
- Cek kemulusan model, pengecekan dapat dilakukan dengan menggunakan melihat tampilan dari MSC/XL.

V.1.2 CEK PROPERTI ELEMEN DAN DIFINISI ELEMEN.

Pada tahap ini dilakukan pengecekan properti elemen menyangkut tebal, luas, momen inersia, sifat material dan orientasi sumbu (khususnya untuk

elemen BAR).

Distribusi properti elemen QUAD4 dan TRIA3 dilakukan dengan menggunakan menu *flat contour* akan terlihat perbedaan elemen tersebut dengan warna elemen disekitarnya. sedangkan distribusi elemen BAR dapat dilihat menggunakan menu *line contour*.

V.1.3 CEK HASIL PERHITUNGAN

Run dari MSC/NASTRAN menghasilkan file-file yang kemungkinan kita untuk melihat hasil perhitungan dan melihat tampilan grafis dari perhitungan tersebut.

Hasil perhitungan dianggap valid bila nilainya mirip dengan perhitungan empiris. validasi juga bisa dilakukan dengan membandingkan bentuk respon pada tiap mode dengan bentuk mode dari referensi.

V.2 ANALISA STATIK

Dari hasil running (seperti terlihat dalam lampiran D) didapatkan displasemen serta tegangan pada elemen pelat ataupun balok penegar.

Sedang hasil dari "running program" ini dapat dilakukan local stress check. pengevaluasian tegangan (*stress check*) sangat diperlukan dalam tahap desain atau redesain, termasuk dalam kasus panel deck, ataupun struktur secara umum.

A. LOCAL STRESS CHECK UNTUK ELEMEN BAR

Dari hasil "running" didapatkan :

- Displasemen maksimum

$$= 7.7507 \text{ mm}$$

- Tegangan tarik maksimum (*Tensile stress*)

$$= 7.326 \text{ kg/mm}^2$$

- Tegangan tekan maksimum (*Compressive stress*)

$$= 9.2095 \text{ kg/mm}^2$$

Berdasar [BKI] tegangan ijin (*Allowable stress*) untuk Web frame, Girder, Transverses Girder adalah sebesar :

$$-\sigma_v = 18.348 \text{ kg/mm}^2$$

Berdasar [AISC] tegangan yang diijinkan jika digunakan material ST41 adalah sebesar :

$$-\text{Tensile stress} = 0.45 F_y = 18.45 \text{ kg/mm}^2$$

$$-\text{Compressive stress} = 0.66 F_y = 27.06 \text{ kg/mm}^2$$

Harga tegangan (*Actual stress*) dari hasil running adalah lebih kecil dari harga tegangan ijin (*Allowable stress*) dari BKI maupun dari AISC. hal ini berarti struktur dianggap memenuhi syarat.

B LOCAL STRESS CHECK UNTUK ELEMEN PELAT.

Dari hasil "running" didapatkan tegangan terbesar pada elemen 128, dan besarnya adalah sebagai berikut :

$$-\text{Stress HVM (Actual stress)} = 2.7969 \text{ kg/mm}^2$$

Sementara harga tegangan (*Allowable stress*) yang diijinkan menurut AISC adalah sebagai berikut :

$$-\text{Allowable Stress} = 0.66 F_y = 27.06 \text{ kg/mm}^2$$

Karena harga tegangan yang terjadi lebih kecil dari tegangan yang diijinkan, maka struktur dianggap masih memenuhi syarat.

Berikut pada gambar 5.1 hingga gambar 5.3 adalah bentuk grafik distribusi tegangan yang terjadi pada elemen BAR dan elemen QUAD4.

GRAFIK TEGANGAN UNTUK ELEMEN BAR

Gambar 5.2 : Grafik Stress Hencky Von Mises pada eksentrisitas $Z = +3 \text{ mm}$

TEGANGAN HENKY VON MISES PADA EKSENTRISITAS = - 3 mm

Gambar 5.3: Grafik Stress Hencky Von Mises pada eksentrisitas $z = -3$ mm

Gambar 5.5 : Bentuk contour tegangan struktur platform 2 nd deck dilihat tegah lurus permukaan

V.3 ANALISA DINAMIS

V.3.1 FREKWENSI NATURAL

Berdasar hasil running program, frekwensi fundamental sebesar 17,91 hz dan displasemen yang dihasilkan sebesar 0,01337

MODE (i)	FREKWENSI NATURAL		DISPLASEMEN MAKS Z
	(Hz)	Radian	
1	1.790777E+01	1.125304E+02	1.33708200E-02
2	1.900827E+01	1.194325E+02	1.204964400E-02
3	2.145530E+01	1.348082E+02	7.2296998E-03
4	2.285115E+01	1.435780E+02	5.6927395E-03
5	2.352805E+01	1.478311E+02	5.7731476E+03
6	2.474998E+01	1.555087E+02	6.4458823E-03
7	2.529999E+01	1.589645E+02	6.5418622E-03
8	2.619452E+01	1.645850E+02	6.3902782E-03
9	2.713583E+01	1.7099995E+02	6.415594E-03
10	2.730940E+01	1.715900E+02	6.9526499E-03

Selanjutnya yang perlu diperiksa adalah kemungkinan terjadinya resonansi. dengan membandingkan frekwensi natural dengan frekwensi eksitasi dapat dideteksi kemungkinan terjadinya resonansi .

Ada tiga sumber eksitasi yang paling berpengaruh terhadap getaran platform 2 nd deck yaitu :

1. Propeller (rpm 344)
2. Bow thruster (rpm 431)
3. Generator (rpm 1500)

Dari tiga sumber diatas, eksitasi propeller dan eksitasi generator dianggap merupakan sumber getaran yang kerap kali menimbulkan permasalahan kusus pada getaran.

Eksitasi propeller timbul karena putaran propeller melalui daerah dimana distribusi wake yang tidak uniform. Pada daerah dimana wake-nya besar akan terjadi kenaikan gaya dorong (*thrust*). Untuk N daun propeller, pada tiap putaran akan terjadi N kali kenaikan thrust sehingga didefinisikan besarnya frekwensi yang disebut blade-rate frekwensi sebagai berikut :

$$f = \frac{\text{RPM} \cdot N}{60}$$

dimana : RPM = putaran propeller permenit

N = jumlah daun propeller.

Untuk kapal passenger " pax 500 " diketahui rpm propeller pada kondisi servis 344 rpm , sedang jumlah daun propeller (N) ada 4 buah . Bila dihitung frekwensi eksitasi propeller adalah 22,9 hz, harga tersebut akan mendekati harga frekwensi natural struktur pada mode ke empat yang besarnya 22,8 hz.

Sedang untuk frekwensi eksitasi dari generator pada putaran 1500 rpm adalah 25 hz, yang mana harga tersebut berada diantara frekwensi natural dari

struktur pada mode ke enam dan mode ke tujuh yang besarnya adalah 24,7 hz dan 25,2 hz.

Berikut pada gambar 5.6 dan 5.7 dapat disimpulkan bahwa frekwensi natural nilainya cenderung meningkat dari mode ke satu hingga mode ke kesepuluh, namun displasemen cenderung menurun. Hal ini berarti pada mode ke satu akan didapatkan perbandingan nilai displasemen yang maksimum.

V.3.2 RESPONS GETARAN

Untuk memperoleh nilai respons getaran struktur platform 2 nd deck akibat eksitasi generator, maka struktur dimodelkan seperti pada gambar 4.7, dimana F_v adalah fungsi yang bekerja pada pondasi mesin dengan sudut phase yang berbeda-beda yang berupa gaya (*Force excitation*), seperti pada gambar 4.3.

Berdasar hasil running seperti pada lampiran F dapat digambarkan bentuk respons getaran seperti gambar 5.9, dimana pada setiap grid akan dihasilkan displasemen yang berubah-ubah, dan displasemen maksimum sebesar 4,095024E-06 mm.

Selanjutnya dengan menggunakan standar ISO seperti pada gambar 5.8 dengan frekwensi 25 hz, displasemen yang terjadi dilakukan pengeplotan pada gambar tersebut. Ternyata displasemen yang terjadi masih memenuhi standar.

Pada gambar 5.7 adalah menggambarkan bentuk distribusi displasemen yang dihasilkan pada tiap-tiap nodal point (*grid*)

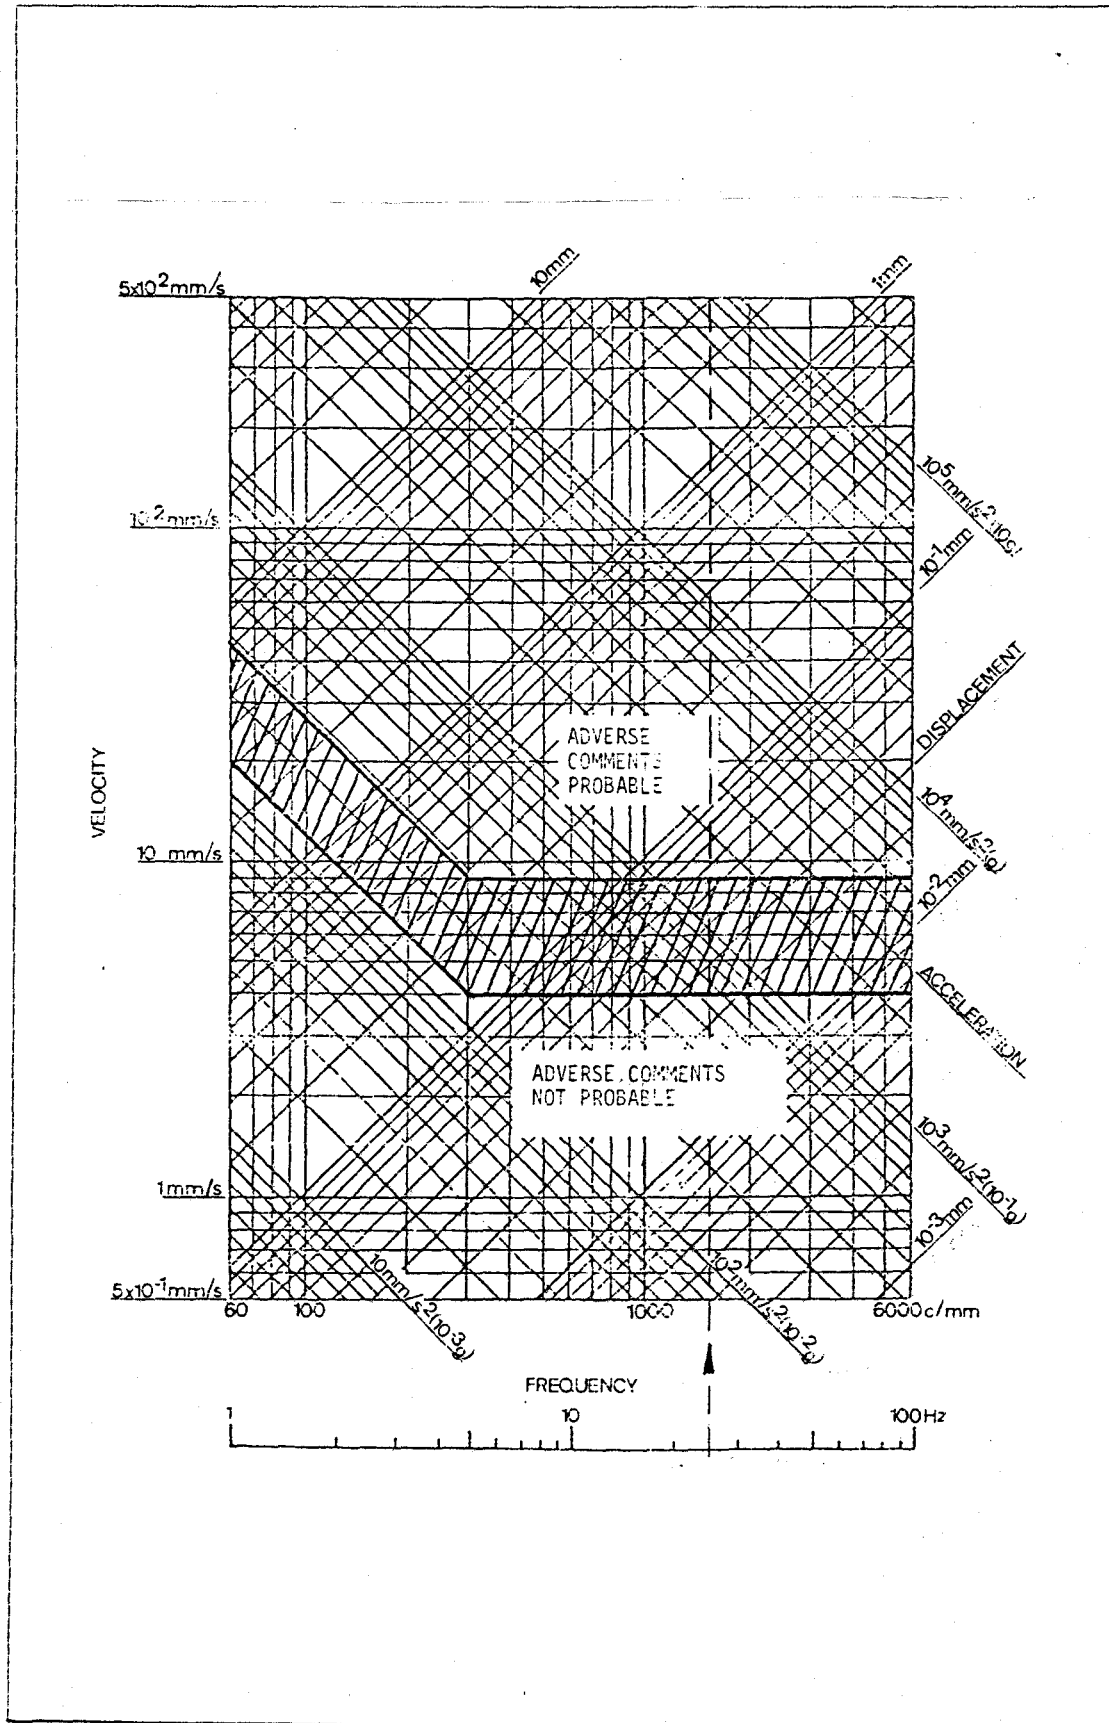

GRAFIK DISTRIBUSI FREKWENSI NATURAL

ANALISA ILASIL DAN VALIDASI MODEL

BAB VI

KESIMPULAN

DAN

PENGEMBANGAN LEBIH LANJUT

VI.1 KESIMPULAN

Dari pembahasan dapat dilihat bahwa untuk analisa statik dengan beban berat generator , struktur platform 2 nd deck masih layak digunakan.

Sedangkan untuk analisa dinamis, berdasar dari analisa hasil perhitungan yang telah dibahas pada bab-bab sebelumnya maka dapatlah diambil kesimpulan sebagai berikut :

- Model yang dibuat dalam analisa menggunakan metode elemen hingga sangat dipengaruhi oleh penentuan dari kondisi batas dari struktur serta pendefinisian constraint pada simpul.
- Struktur akan terjadi resonansi pada mode ke empat, yaitu pada frekwensi naturalnya sama dengan 22,8 hz yang mana harga frekwensi naturalnya mendekati harga dari frekwensi eksitasi dari propeller sebesar 22,9 hz. Demikian pula pada mode ke enam dan mode ke tujuh yang besarnya frekwensi natural adalah 24,75 hz dan 25,29 hz akan terjadi resonansi dengan frekwensi eksitasi dari generator yang besarnya frekwensi eksitasi adalah sebesar 25 hz.
- Dalam hubungannya dengan respons getaran, displasemen maksimum yang

dihasilkan sebesar $4,095024 \times 10^{-6}$ mm, struktur masih layak digunakan.

- Diperlukan Re-design struktur karena frekwensi natural struktur masih belum dianggap aman.
- Hasil akan mendekati kenyataan jika dalam perhitungan dimasukkan komposisi beban yang bervariasi yaitu beban akibat pengaruh mesin induk atau beban yang berpengaruh lainnya

VI.2 PENGEMBANGAN LEBIH LANJUT

Setiap pendekatan analisa ataupun metode yang telah diambil, selalu dapat dikembangkan kedalam pendekatan yang lebih umum. Hal ini dapat dilakukan dengan memperbaiki pemodelan, asumsi, ataupun penyelesaian yang lebih luas.

Dalam analisa struktur platform 2 nd deck ini dapat dikembangkan yang lebih kompleks, dalam hal ini adalah :

- Pengaruh beban akibat mesin induk, karena dengan adanya beban mesin induk tersebut akan menimbulkan gaya eksitasi (*Base eksitation*) yang didistribusikan melalui frame (*Girder*).
- Pengaruh putaran generator yang tidak hanya pada kondisi putaran kon-tinyu.
